

Does your child have a diagnosis of autism spectrum disorder (ASD)?

A research study may be right for your child

We are looking for children and teenagers who are:

- 5–17 years of age* with a diagnosis of autism spectrum disorder
- experiencing irritability, which can be expressed as tantrums, aggression, yelling, or self-harming behavior.

*We are currently only enrolling teenagers who are 13–17 years of age. Younger children will be enrolled later.

The 601/602 Pediatric Autism Study is looking at a potential new (investigational) medication (“study drug”) for irritability in autistic children and teenagers. It is hoped that the study drug can:

- help restore the balance of chemicals in the brain that are important for regulating mood

- reduce the severity of irritability and behaviors linked with it.

The study will look at 2 different doses of the study drug and compare them with a placebo. Your child will be randomly assigned to receive the study drug or a placebo. The study drug comes as a capsule and will be taken once a day.

This study will last for about 2 months and include up to 9 study center visits.
